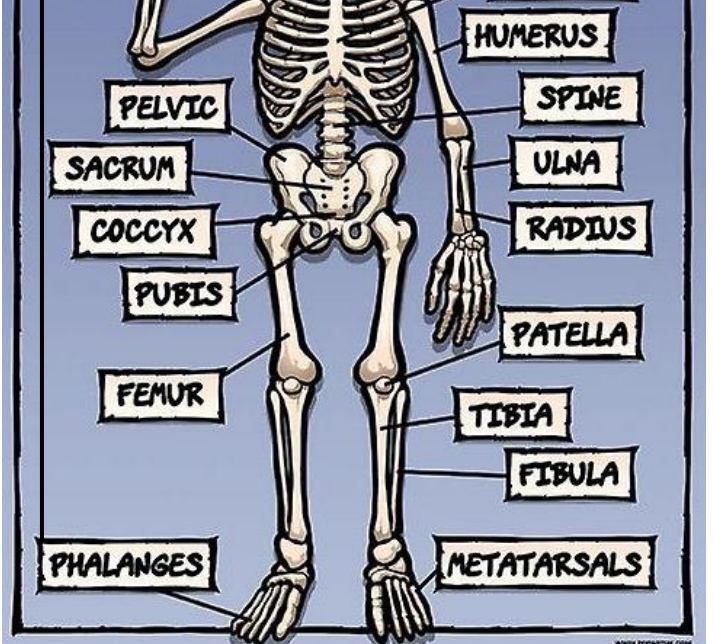
INSTRUCTIONS

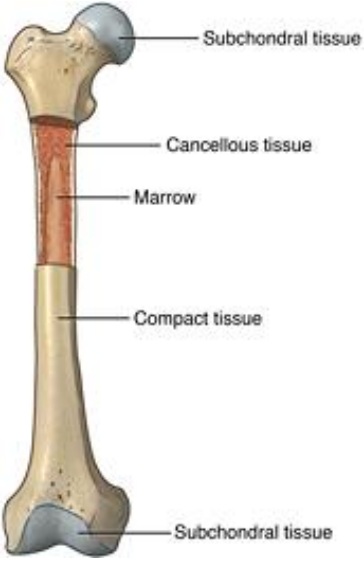
Your task is to cut out and assemble the bones in the human body into a complete skeleton. There are 206 bones in a grownup human body. (Babies have more bones that fuse together as they mature.) This kit does not show ALL of those bones—for instance, the teeny-tiny ones in your eardrums-–but you can research them in books or online.



Skeleton template: https://www.adventure-in-a-box.com /product/ life-size-printable-skeleton-paper-model/

WHAT IS THE SKELETAL SYSTEM?

The **skeletal system** provides us with our human shape and features. It is our body's central framework and is made up of bones and connective tissue, including **cartilage**, **tendons**, and **ligaments**.



Your skeletal system does more than keep us together! It also allows us to move; produces blood cells; protects and supports organs; and stores minerals.

Skeletons are generally shown with teeth. However, teeth are not bones. They are part of the digestive system.
